Company Background

Quick Mount PV began in 2006 designing and manufacturing innovative waterproof mounting systems for rooftop solar electric (PV) and solar thermal (hot water) systems.

Stuart and Claudia Wentworth founded Quick Mount PV as the natural outgrowth of their 20 years in the metal fabrication, green building and construction trades. During their seven years as solar PV installers before launching the company, the Wentworths saw far too many mounting methods in use that were doomed to failure, posing a threat to the burgeoning solar PV industry's reputation.

With a passion for solar energy and a deep commitment to doing solar right, the Wentworths founded Quick Mount PV to bring a quick, cost-effective, completely code-compliant waterproof mounting system to the industry.

Quick Mount PV products were an instant hit in a market hungry for quality mounting solutions, and the company has grown at greater than 100 percent annually to meet the rising demand. It currently employs 62 people in its fabrication and warehouse facility in northern California. In Q3 2011, the company announced a major expansion into a new 133,000 sq. ft. facility in Walnut Creek, CA, scheduled for Q1 2012.

In Q2 2011 the company released its first PV mount for the non-metal commercial low slope roofing market and expanded its line of 100 percent code-compliant steep slope residential mounts with two products designed specifically for new composition roofs and any kind of tile. All three new products feature the company's innovative QBase, the strongest off-the-shelf mechanical mount currently available.

Quick Mount PV's commitment to quality solar installations extends to its first-rate tech support and customer service. The company offers ongoing training opportunities and personalized assistance to installers using Quick Mount PV products.
